

Chapter 3 Error Log

These are the problems I found while checking the Chapter 3 programs and organizing the Eclipse project.

Program	Problem noticed	What I changed
Digits	The two output lines were in the wrong order for the question.	I printed the ones-place digit first and the tens-place digit second. I checked 47 and 90.
GradeAvg	The first version calculated from an array, but part 2 uses a running total and the number of grades. Integer division could also drop the decimal part.	I changed the method to use total and numberOfGrades, then cast the total to double before dividing.
RectanglePerimeter	There was an extra starter Rectangle class after the completed RectanglePerimeter class was added.	I kept the required RectanglePerimeter program and removed the unused starter copy.
Eclipse packages	The package folder names did not match the organization used in the class example.	I organized the programs into skillbuilders and mastery and updated the test package names to match.

Final check: the Java source compiled successfully, and the saved Eclipse JUnit screen dump shows 10 tests passed with 0 errors and 0 failures.
