

Chapter 3 Reflection Log

Skill builders, mastery exercises, and JUnit evidence

RectanglePerimeter • page 53

This one was pretty simple. I used the perimeter formula with width 4 and length 13. I got 34 by hand, and the program gave me the same answer.

Digits • page 58

I used division and the % operator to split the two digits. I tested 47 and 90 because 90 checks that the program can show 0 in the ones place.

GradeAvg • pages 59 and 61

I used a loop to enter the five grades instead of writing the same input line five times. The += operator adds each grade to the total. I changed the total to a double so the average can have decimals.

PizzaCost • Exercise 2

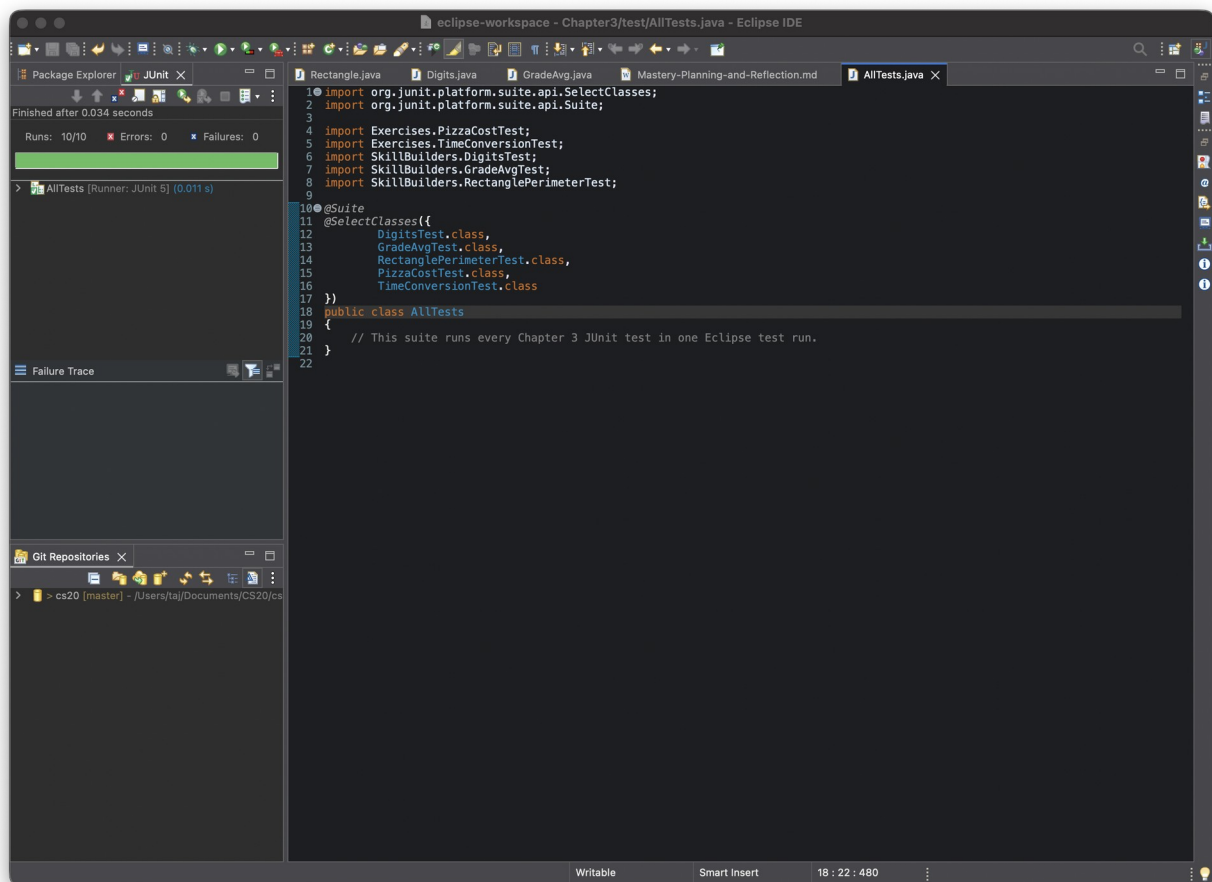

I used constants for the labour, rent, and material costs so I would not have to type the numbers again. I tested the 10-inch example and one other size.

TimeConversion • Exercise 8

I used division to get the hours and the % operator to get the minutes left over. I used two digits for the minutes so 184 minutes prints as 3:04.

JUnit test evidence

I ran AllTests in Eclipse on September 24, 2026. All 10 tests passed with no errors or failures.

Eclipse JUnit 5 result: 10/10 tests passed, with 0 errors and 0 failures.
